

MAIN(GITHUB)

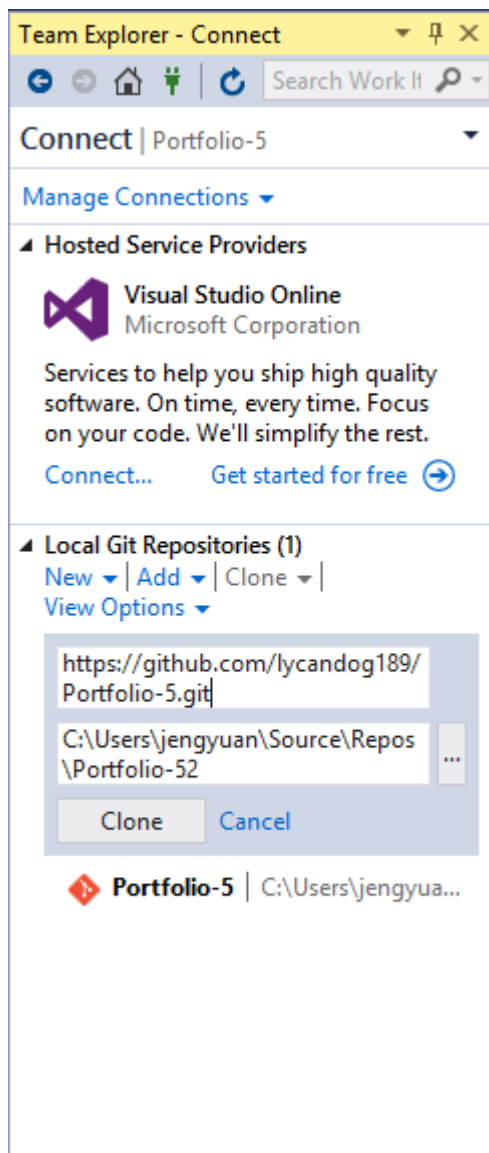

GitHub is a web-based Git repository hosting service. It offers all of the distributed revision control and source code management(SCM) functionality of Git as well as adding its own features. Unlike Git, which is strictly a command-line tool, GitHub provides a Web-based graphical interface and desktop as well as mobile integration.

The best feature about GitHub is a person could access another person's file and make changes to it. An example would be if my friend wants me to make changes to a project in Visual Studio, he can put his files on GitHub and I am able to take his files and make changes to it. Thus, I will make a short demo on how GitHub works.

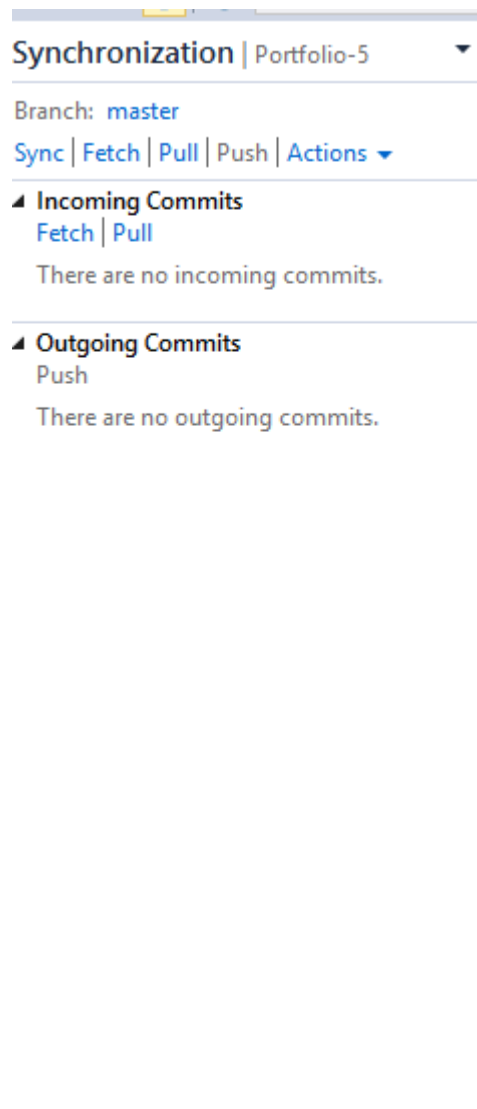

Firstly, you and your friend would need to sign up as a GitHub user, then make a public repository so other people can make changes to that particular repository. Then, after adding one another, they can make changes to each other's files

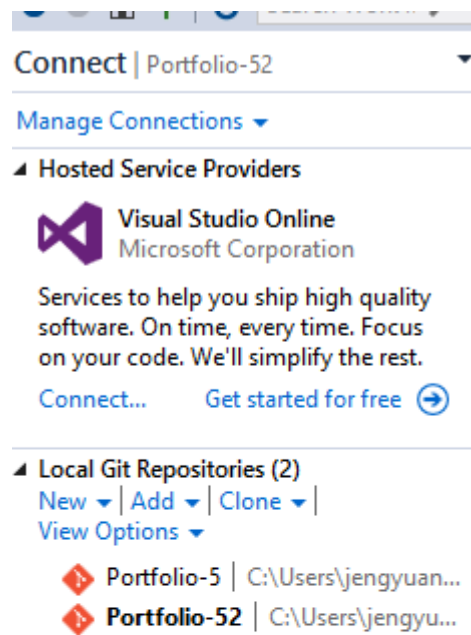

First, I accessed lycandog189's repository, then I copied the github link in able to make changes to his Portfolio 5 file

I pasted the link in the link box which is found in Visual Studio, then I clicked the clone button to connect to lycandog189's github Portfolio 5. Then I waited for the cloning to be completed

After that, I pulled the Portfolio 5 file from lycandog's repository to make changes to his current project.

Lycandog's Portfolio 5 is now in my visual studio.

```
#include <iostream>

using namespace std;

int main()
{
    cout << "Portfolio 5" << endl;
    system("PAUSE");
}
```

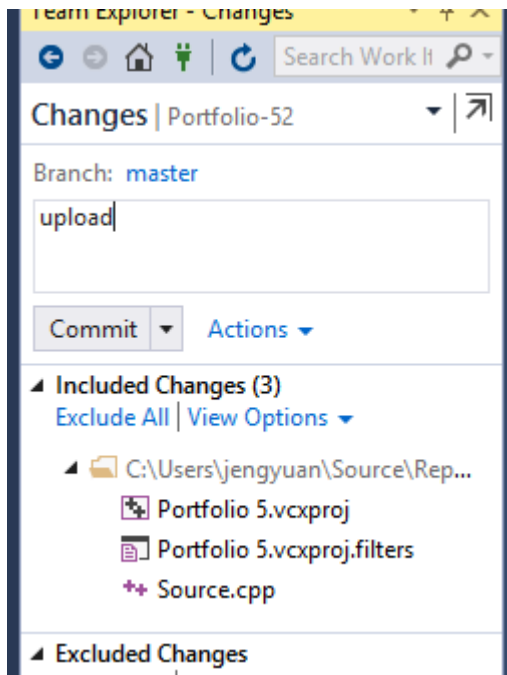

This is his current file without making changes yet

```
#include <iostream>

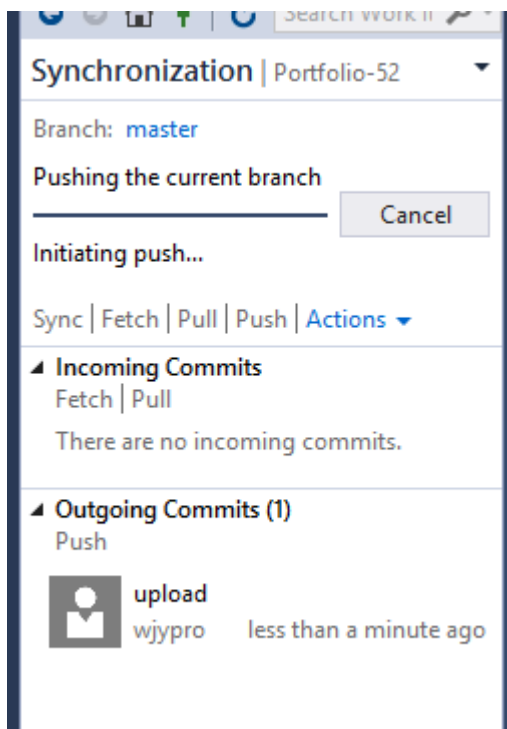

using namespace std;

int main()
{
    cout << "Portfolio 5" << endl;
    cout << "hello world!" << endl;
    system("PAUSE");
}
```

I added a line called cout << "hello world! << endl; to see if there will be changes later.

After adding that line, I put a name called upload(can be any name at all) and click commit which will commit any changes done.

Then I click the push button which sends the changes I made back to lycandog's github.

lycandog189 / Portfolio-5

10 lines (8 sloc) | 140 BytesRawBlameHistory

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     cout << "Portfolio 5" << endl;
8     cout << "hello world!" << endl;
9     system("PAUSE");
10 }
```

After opening his github, the line (cout << "hello world!" << endl;) is added, thus changes are made to his Portfolio 5 file.
